

DHELIVER

UI Design Project Documentation

Project Type	Delivery & Transportation Mobile Application
Role	UI/Visual Designer
Designer	Benedict Nwuzor
Design Tool	Figma
Design Deliverables	Wireframes & High-Fidelity UI Designs
Project Status	Design Completed

CodeAlpha 2026 Project Submission

1. Project Overview

Dheliver is a mobile delivery and transportation application concept designed to support package delivery activities for customers and riders.

For this project, the work focused specifically on the visual design of the application, including the creation of wireframes and high-fidelity user interface screens in Figma. The designs cover key customer and rider screens and demonstrate how the application interface could be structured and presented visually.

2. Project Scope

The scope of this project was focused on UI design rather than a full UX research or UX strategy process.

- Low-fidelity wireframes were created to establish screen structure and layout.
- High-fidelity UI designs were developed from the wireframe concepts.
- The visual identity, screen layouts, components and interface elements were designed in Figma.
- The project includes customer-facing and rider-facing interface screens.
- No claim is made that formal UX research, usability testing, UX strategy or product development was completed as part of this project.

3. Design Objectives

- Create clear and visually organized mobile application screens.
- Translate the delivery-app concept into practical wireframe layouts.
- Develop polished high-fidelity interfaces from the wireframes.
- Maintain a consistent visual identity across the application screens.
- Present important delivery information in a clear and readable way.
- Design separate interface experiences for customers and riders.
- Create a professional Figma design file suitable for presentation and review.

4. Intended Users

Customers

The customer side of the interface is intended for people who need to send packages from one location to another.

- Create delivery requests
- Provide pickup and destination information
- Provide package information
- Review delivery details
- Access payment options
- View delivery status
- Communicate with riders
- View delivery history

- Schedule deliveries
- Rate riders

Riders

The rider side of the interface is intended for individuals who accept and complete delivery requests.

- Go online or offline
- Receive delivery requests
- Manage incoming, active and completed orders
- View earnings
- Access wallet and withdrawal functions
- Manage rider profile
- Complete KYC-related screens
- Provide vehicle information
- Communicate with customers

5. Customer-Side UI Screens

Onboarding & Authentication

The design includes onboarding screens and authentication interfaces for introducing the application and providing access to the customer experience.

Home Interface

The customer home interface serves as the primary visual entry point into the application and presents key delivery actions and information.

Delivery Creation

The design covers screens for creating a delivery, sending a package, entering delivery information, reviewing the details and confirming the request.

Tracking

Tracking screens are designed to visually communicate delivery progress and rider-related information.

Chat

Chat screens provide a visual interface for communication between the customer and rider.

Scheduling

Scheduling screens are included to support planned delivery requests.

Payments

The payment interface includes designs for payment methods such as VISA, Verve, Mastercard, Paystack, bank transfer and Opay.

History & Rating

The interface includes delivery history and filtering concepts, as well as a rider-rating screen for completed deliveries.

6. Rider-Side UI Screens

Rider Dashboard

The rider dashboard design presents information such as wallet balance, earnings, delivery activity and delivery notifications. It also includes an Online/Offline control.

Orders

The rider orders interface is organized into Incoming, Active and Completed sections.

Earnings & Withdrawal

The design includes interfaces for viewing earnings and accessing withdrawal functionality.

Rider Profile

The rider profile design includes KYC, vehicle details, settings and support areas.

KYC & Vehicle Details

The rider-side designs include KYC-related screens, including a selfie-upload concept, as well as vehicle-information screens.

7. Wireframe Design

The wireframes were used as the structural foundation of the application screens. They helped establish the placement of content, navigation elements, buttons, cards, forms and other interface components before the high-fidelity visual design stage.

- Focused on screen structure and content placement.
- Established the basic arrangement of interface elements.
- Provided a foundation for the high-fidelity designs.
- Helped maintain consistency between related screens.

8. High-Fidelity UI Design

The high-fidelity stage translated the wireframe structures into polished mobile interfaces. This stage focused on visual presentation, typography, spacing, colors, buttons, cards, icons, imagery and other interface elements.

The high-fidelity designs were created in Figma and follow the Dheliver visual direction of orange, white and black.

9. Visual Design System

Color	Value	Use
Orange	#FF6B00	Brand accent, primary actions and highlights
White	#FFFFFF	Backgrounds, cards and visual space

Color	Value	Use
Black	Black	Text, icons and supporting interface elements

The intended visual balance is approximately White — 70%, Orange (#FF6B00) — 20%, and Black — 10%.

10. Design Principles Applied

- Clarity — interfaces are arranged so that key information and actions are easy to identify.
- Consistency — colors, components, spacing and visual patterns are reused across related screens.
- Visual Hierarchy — primary actions and important information receive stronger visual emphasis.
- Simplicity — screens avoid unnecessary visual complexity.
- Brand Consistency — the orange, white and black palette is used consistently throughout the designs.

11. Tools Used

- Figma — used for wireframing, high-fidelity UI design, screen layouts, visual components and design presentation.

12. Design Deliverables

- Low-fidelity wireframes
- High-fidelity UI designs
- Customer-side mobile screens
- Rider-side mobile screens
- Delivery creation screens
- Tracking screens
- Payment screens
- Chat screens
- History screens
- Rider dashboard
- Rider order screens
- Rider earnings screens
- Rider KYC screens
- Vehicle details screens
- Profile screens

13. Figma Design File

The complete Dheliver design work, including the wireframes and high-fidelity UI designs, is available in the Figma file below:

14. Project Outcome

The project resulted in a structured set of Dheliver mobile application wireframes and high-fidelity UI designs. The work demonstrates the progression from basic screen structure to polished visual interfaces for both customer and rider experiences.

The final Figma file serves as the main design presentation and contains the completed visual design work for the project.

15. Conclusion

Dheliver is a delivery and transportation application concept presented through a set of wireframes and high-fidelity mobile UI designs.

The project demonstrates the ability to translate an application concept into organized screen layouts and polished visual interfaces while maintaining a consistent brand direction across different parts of the application.
